

Global economic growth and near-term prospects: A mixed track record.

By: James R. Solloway, CFA, Chief Market Strategist and Senior Portfolio Manager

SEI recently released its first-quarter Economic Outlook, published in two installments. Here is a summary of our key perspectives from the first installment, focusing on global economic growth and near-term prospects for selected countries.

- The U.S. keeps rolling along, posting solid gains that have mostly surprised to the upside. Most other major advanced economies seem to be stuck on a siding, hoping to at least hitch themselves to the mighty U.S. locomotive. The previous big engine in the world—China—still runs faster than the U.S., but is not the bullet train that it once was.
- While China continues to gain share of world gross domestic product (GDP), it still lags the U.S. and the eurozone. The U.S. has recorded an increasing share of world GDP volumes in recent years, reversing the trend in place from 2003 to 2019. Meanwhile, the U.K., the eurozone, and Japan have seen their economies lose ground against the rest of the world, though the U.K.’s decline following Brexit has been mostly recovered, and Canada has exhibited remarkable steadiness in its share of world GDP.
- The U.S. economy got off to a fast start in January as the economy accelerated well above its long-term average growth potential. In the fourth quarter of 2023, the U.S. reported a gain of 3.1% from a year earlier, outpacing most other major advanced economies. Economic growth in the U.S. will likely slow, but there is little sign that a recession is looming. Until there is more substantial weakness in employment trends, it is probably a mistake to get too bearish on the U.S. consumer.
- Historically, Canada has been joined at the hip to the United States, exporting more to the U.S. than any other country. However, it lost its #1 position to China in 2009, and fell into third place behind Mexico in 2022. Chinese exports to the U.S. have declined sharply due to trade frictions, while Mexico continues to gain export share. It will likely continue to benefit from nearshoring, given the competitive advantages bestowed upon it by the United States-Mexico-Canada Agreement on free trade.
- For the first time since the early 1990s, Germany’s economy appears to be in a multiyear morass. Germany’s heavy exposure to manufacturing has become a liability after COVID-19’s disruption to supply chains and a spike in natural gas prices due to Russia’s invasion of Ukraine. Germany’s manufacturing, construction, and services sectors are seeing contractionary conditions.
- While China’s leading indicators suggest improvement, it will take a while to show up broadly and sustainably in the country’s industrial activity as recent data suggest continued contraction in the manufacturing sector. Consumer and business confidence also remain depressed. The government’s modest efforts to support the economy—through lower interest rates, reductions in banks’ required reserve ratios, tax cuts, infrastructure spending, and measures to bolster the housing market—have yet to pay off. While China’s problems are not an exact replay of the Global Financial Crisis, there are similarities because it will take time for households, businesses, and local governments to delever and repair their balance sheets. Even if the Chinese central government becomes more aggressive in its rescue efforts, it could take several more years for the economy to adjust.
- Japan’s Nikkei 225 index recently broke into record territory for the first time since December 31, 1989, after a long period of economic decline, deflation, and an 80% tumble in the broad stock market. The turnaround in equity prices began around 2013 with aggressive fiscal expansion, easy money, and structural reforms. At long last, Japan has shaken off its deflationary tendencies. Although headline consumer prices have fallen sharply over the past year, the recent rebound in petroleum prices suggests that overall inflation is unlikely to decline much further and, more importantly, core prices are still quite elevated.
- In summary, the global economic outlook still looks quite mixed, but there are scattered signs of modest improvement. The U.S. is still leading the way, but other countries could pick up steam in the months ahead. China’s outlook remains uncertain—the cyclical outlook should improve, but the structural challenges are immense. If government policy becomes more aggressively stimulative, it could provide an important boost to global growth.

Glossary

Brexit is a combination of “Britain” and “exit,” referring to the United Kingdom’s withdrawal from the European Union on January 31, 2020.

The **Global Financial Crisis (GFC)** refers to the period of extreme stress in global financial markets and banking systems between mid-2007 and early 2009.

Gross domestic product (GDP) is the total monetary or market value of all the goods and services produced in a country during a certain period.

Important information

This material represents an assessment of the market environment at a specific point in time and is not intended to be a forecast of future events, or a guarantee of future results. Positioning and holdings are subject to change. All information as of the date indicated. There are risks involved with investing, including possible loss of principal. This information should not be relied upon by the reader as research or investment advice, (unless you have otherwise separately entered into a written agreement with SEI for the provision of investment advice) nor should it be construed as a recommendation to purchase or sell a security, including futures contracts. The reader should consult with their financial professional for more information.

Statements that are not factual in nature, including opinions, projections and estimates, assume certain economic conditions and industry developments and constitute only current opinions that are subject to change without notice. Nothing herein is intended to be a forecast of future events, or a guarantee of future results.

Certain economic and market information contained herein has been obtained from published sources prepared by other parties, which in certain cases have not been updated through the date hereof. While such sources are believed to be reliable, neither SEI nor its affiliates assumes any responsibility for the accuracy or completeness of such information and such information has not been independently verified by SEI.

There are risks involved with investing, including loss of principal. The value of an investment and any income from it can go down as well as up. Investors may get back less than the original amount invested. Returns may increase or decrease as a result of currency fluctuations. Past performance is not a reliable indicator of future results. Investment may not be suitable for everyone.

Diversification does not ensure a profit or guarantee against a loss. International investments may involve risk of capital loss from unfavorable fluctuation in currency values, from differences in generally accepted accounting principles or from economic or political instability in other nations. Emerging markets involve heightened risks related to the same factors as well as increased volatility and lower trading volume. Narrowly focused investments and smaller companies typically exhibit higher volatility. Bonds and bond funds will decrease in value as interest rates rise. High-yield bonds involve greater risks of default or downgrade and are more volatile than investment-grade securities, due to the speculative nature of their investments.

Index returns are for illustrative purposes only and do not represent actual portfolio performance. Index returns do not reflect any management fees, transaction costs or expenses. One cannot invest directly in an index.
